CRONS

1
KNOWLEDGE GRAPH

55+
TOTAL FILES

The thesis: A fresh Claude Code install is a genius with amnesia. This kit gives it institutional memory, quality enforcement, and compound learning from Day 1. Every session makes the next one better. Every correction persists forever. The system builds itself from your work.

Rules 8

Loaded automatically every session. Claude reads these as standards — no re-explaining needed. Ever.

Rule	What It Enforces	Value
communication.md	SE voice: 50+ banned AI-slop words, email under 200 words, customer-centric framing, Slack conventions	Every output sounds like you wrote it
security-governance.md	CRUD/FLS checks, sharing model, secrets handling, security review checklist on all code	Never generates insecure code
architecture.md	Decision framework, preferred patterns, anti-patterns, change design documentation template	Consistent architecture decisions
agent-script.md	Agentforce/Agent Script conventions, deterministic routing patterns	Correct agent authoring
salesforce-instructions.md	Senior SF SE persona, platform-first, inspect before proposing, small reversible changes	Claude acts like an experienced SE
salesforce-platform.md	Bulk-safe Apex, thin triggers, one per object, LWC patterns, named credentials	Production-quality SF code
testing-quality.md	Realistic test data, meaningful assertions, quality gate mindset, no seeAllData	Tests that catch real bugs
slds2-lwc-ui.md	SLDS 2 styling hooks, token migration, no hardcoded values, no class overrides	Modern, compliant LWC

Hooks

6

Code that runs mechanically before/after Claude acts. Unlike rules (which can be forgotten in long sessions), hooks execute as scripts. They intercept mistakes at the moment of action.

Hook	When	What It Does	Value
session-init.py	Session start	Routes relevant wiki pages, surfaces recent work, shows nudges for overdue actions	Every session starts with context
guardrail.py	Before Edit/Write	Blocks unsafe architecture patterns before code is written	Prevents infra violations at point of action
product-verification.py	Before Edit/Write	Catches hallucinated SF product names (Einstein Copilot, Agentforce Script, etc.) with corrections	No wrong product names in customer content
output-quality-gate.py	After Write	Scans .md/.html for 50+ banned words, reports exact line numbers	Content quality enforced mechanically
graph-auto-index.py	After Write/Edit	Indexes entities into SQLite knowledge graph, computes REFERENCES and RELATES_TO edges	Knowledge graph grows from your work
soql-schema-check.py	Before SOQL	Validates field names against org schema before query execution	Catches bad SOQL before deploy

Skills 22

Each skill replaces 15-60 minutes of manual work. Say the command, get the output.

Core SE Workflows (7)

Command	What It Does	Time Saved
/account-prep	Full pre-meeting intelligence: company + CRM + competitive + suggested agenda	30 min → 2 min
/deal-strategy	Competitive positioning + talk track + objection handling for a specific deal	45 min → 3 min
/email-draft	Customer email: anti-slop, under 200 words, seniority-matched tone	15 min → 30 sec
/post-meeting	Capture outcomes, action items, CRM update draft, follow-up email	20 min → 2 min
/demo-prep	Demo script from account context, persona-driven delivery coaching	30 min → 3 min
/engagement-playbook	Per-persona strategic playbook with stakeholder map and objection matrix	60 min → 5 min
/solution-design	Solution architecture for customer deals with branded deliverables	2 hrs → 15 min

Quality Assurance (3)

Command	What It Does	Time Saved
/validate	Cross-model quality gate: 5 dimensions, SHIP / FIX FIRST / REWRITE verdict	Manual review → automated
/voice-check	Anti-slop scanner: full 50+ word banned list, replacements, pass/fail	Catches what you'd miss
/content-review	6-dimension reviewer: accuracy, voice, specificity, customer-centricity, actionability, credibility	Peer review → instant

Intelligence & Growth (5)

Command	What It Does	Time Saved
/morning-brief	Daily context: overnight intel, git status, memory changes, suggested actions	15 min → instant
/scan-intel	Intelligence sweep: web + social → categorized ADOPT / EVALUATE / WATCH	30 min → 3 min
/ingest	Process any source (PDF, URL, doc) into wiki pages with entity extraction	Manual notes → structured
/week-plan	Weekly planning: deals + intel + projects + priorities + blockers	30 min → 5 min
/weekly-report	Status from git + memory + wiki → shipped / in-progress / blocked	Manual tracking → auto

System Maintenance (4)

Command	What It Does	Time Saved
<code>/curate</code>	Memory maintenance: staleness scan, promotion, inbox processing, orphan detection	Knowledge stays healthy
<code>/wiki-lint</code>	Wiki health check: orphans, dead links, stale pages, broken structure	Wiki stays trustworthy
<code>/system-health</code>	Diagnostics: hooks firing, rules loading, graph growing	Debug your setup
<code>/graph-query</code>	Query knowledge graph: relationships, connections, related files, hub entities	"What relates to X?" → instant

Compound Loop (3)

Command	What It Does	Time Saved
<code>/skillify</code>	Meta-skill: do work → extract pattern → new permanent command. Skills build skills.	Manual skill authoring → auto
<code>/context-load</code>	Cross-project context restore: load state from another project into current session	Context switching → instant
<code>/pr-review</code>	PR review against SF architecture and security standards	Manual checklist → automated

Knowledge Graph

A local SQLite graph that grows automatically from your work. No external infrastructure — just Python + SQLite, works offline.

Component	What It Does	How It Helps
<code>graph-auto-index.py</code> hook	Every Write/Edit indexes entities, computes relationship edges	Graph builds itself — zero maintenance
<code>/graph-query</code> skill	Query relationships, find connections, discover related files	Surface context you didn't know existed
<code>wiki/entities/</code>	Company, product, concept pages indexed by the graph	Structured knowledge for traversal
<code>wiki/people/</code>	Person pages with org trees and interaction timelines	Relationship intelligence that compounds

How it compounds: Write about a deal. The hook indexes the account, people, and products mentioned. Next time you prep for that account, the graph surfaces related wiki pages, other deals with the same people, and memory files you'd forgotten. The more you write, the smarter retrieval gets.

Passive Intelligence (Crons)

6

Your knowledge base grows while you sleep. These run on schedule without manual effort.

Script	Schedule	What It Does
exa-scan.py	Daily 4:30 AM	5-query web intelligence: accounts, competitors, SF product, trends, Claude ecosystem
hn-scan.py	Daily 4:45 AM	4-query Hacker News developer sentiment (free, no auth needed)
github-scan.py	Daily 4:45 AM	Trending AI repos + release monitoring on competitor frameworks
morning-digest.sh	Daily 5:30 AM	Synthesizes all raw intel into wiki/inbox.md via Claude
memory-decay-check.sh	Weekly (Sun)	Flags memory files unchanged >45 days — catches stale knowledge
manage.sh	Manual	Install / uninstall / status / test all crons with one command

Wiki Structure

7 directories

Pre-built directory structure. Ready to fill from Day 1.

Directory	What Goes Here	How It Grows
wiki/concepts/	Patterns, frameworks, competitive analysis	/ingest, /scan-intel, manual
wiki/entities/	Companies, products, concepts (graph-indexed)	/account-prep, /engagement-playbook
wiki/people/	Person pages — internal and external contacts	Slack profiles, /post-meeting
wiki/projects/	Project overviews and status	Manual — one page per project
wiki/tools/	Tool docs and setup guides	/ingest when learning new tools
wiki/events/	Conference notes, event summaries	/ingest after events
wiki/insights/	Research findings, analytical work	/scan-intel ADOPT items

The Compound Effect

No single component is transformative alone. The value is in how they interact:

Day 1: You correct Claude → Memory file saved

Day 3: Same mistake class → Rule prevents it automatically

Day 7: Rule forgotten in long session → Hook enforces mechanically

Day 14: Hook catches a pattern → /skillify extracts it into a new command

Day 30: Overnight crons feed intel → Morning brief surfaces it

Day 60: Graph connects entities → Related context surfaces automatically

Starting matters more than perfecting. A mediocre setup that runs for 60 days beats a perfect setup that runs for 1 day. Compound growth is the product. The kit gives you Day 5 — compound loops take over from there.

Setup (30 minutes)

Step	What Happens	Time
1. Clone	<code>git clone github.com/jtehrani84/claude-code-se-starter-kit</code>	1 min
2. Run setup	<code>./setup.sh</code> — copies templates, asks your role/OU, generates CLAUDE.md	5 min
3. Personalize	Edit CLAUDE.md with your projects, constraints, routing table	10 min
4. Test	Open Claude Code, run <code>/account-prep [your account]</code>	2 min
5. Activate crons	<code>crons/manage.sh install</code> (optional — enables overnight intel)	2 min
